

EXPERIENCE BUILDING WEBSITE

When I first started learning web development, I felt confused because there were many new things to learn. I started by learning basic HTML and CSS little by little. At first, I only created simple web pages with plain text and simple colors, but I was happy because I could make something using my own code.

After understanding the basics, I tried creating my first portfolio website. I spent a lot of time choosing colors, layouts, and designs because I wanted the website to look clean and interesting. Sometimes my code did not work properly, and I often found errors that made the website layout messy.

Even though it was difficult, I kept trying and learning from my mistakes. I learned how to arrange layouts using Flexbox and how to make responsive websites that look good on both phones and laptops. I also started learning JavaScript to make the website more interactive and fun.

One of the most exciting moments was when I successfully finished one of my website projects by myself. I felt proud because I could see my progress little by little. Through every project, I learned to be more patient, creative, and consistent while coding.

From this experience, I realized that creating websites is not only about coding, but also about creativity and problem solving. Even though I am still learning, I enjoy the process because every project helps me improve my skills and confidence. I hope I can continue learning and create even better websites in the future.
